Python File writelines() Method

◀ File Methods

Example

Open the file with "a" for appending, then add a list of texts to append to the file:

```
f = open("demo3file.txt", "a")
f.writelines(["See you soon!", "Over and out."])
f.close()

#open and read the file after the appending:
f = open("demo3file.txt", "r")
print(f.read())
```

Run Example »

Definition and Usage

The `writelines()` method writes the items of a list to the file.

Where the texts will be inserted depends on the file mode and stream position.

"a" : The texts will be inserted at the current file stream position, default at the end of the file.

"w" : The file will be emptied before the texts will be inserted at the current file stream position, default 0.

Syntax

```
file.writelines(list)
```

Parameter Values

Parameter	Description
<i>list</i>	The list of texts or byte objects that will be inserted.

More examples

Example

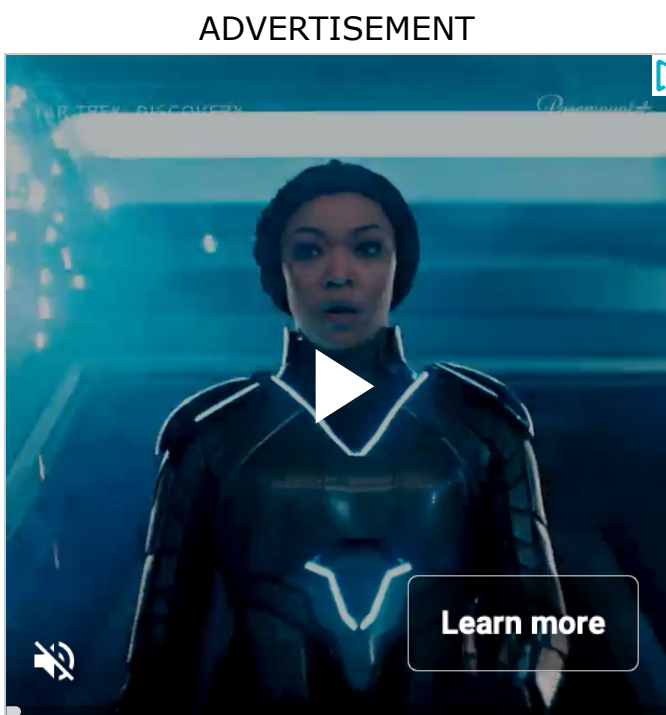

The same example as above, but inserting line breaks for each list item:

```
f = open("demo3file.txt", "a")
f.writelines(["\nSee you soon!", "\nOver and out."])
f.close()

#open and read the file after the appending:
f = open("demo3file.txt", "r")
print(f.read())
```
